

Precision Science®

Pellets

Precision Science's pelletizing process ensures that the product specifications are manufactured in a reliable and competitive manner. In our state of the art facility, we are able to complete both short and continuous production runs.

For over two decades, Precision Science has been designing and engineering pelletized products for the animal health industry. Whatever your pelletizing needs, we have the capabilities to make it happen.

Pelletizing is a process in which a mix is turned from a powder into a pellet, using one of two separate pellet mills.

- ① Our smaller pellet mill can produce up to 5000 lbs per hour, depending on your specifications.
- ② Our larger pellet mill can produce up to 10,000 lbs per hour, depending on your specifications.
- ③ Currently, we make a 5/32 diameter pellet, but have the capabilities to manufacture other size diameters.
